

ABSTRACT

This invention relates to a technology for determining the constitution of a human being by the use of a computer. For the purpose of a precise determination of the constitution, this invention is constructed such that the constitution is determined as one of a predetermined plurality of types, on the basis of a distribution pattern reflecting how a population consisting of tendencies of the human being to show with respect to respective items has been scattered over a range of ranks (ranging from a yin-rank to a yang-rank through a medium-rank) indicative of strengths of the tendencies. The plurality of types consist of basic or independent types A, B, C, D, and E, and compound types AB, AD, BC, CD, and E+.
